

# Cellular Automaton Performing Two-Coloring of Square Tiled Planes

**Jiri Kroc\*†**

\*Helsinki School of Economics, Mikkeli, Finland

†University of West Bohemia, Plzen, The Czech Republic

# Motto

---

**It does not matter how good you are  
in it. The NATURE does it always  
better!**

# Outline

---

- Motivation
- Deterministic, two-colouring of square tiled planes with four neighbours
- Two-colouring in presence of three neighbours, a note
- The Penrose tiling – future work
- Future > towards the general rule
- Conclusions

# Motivation

---

- The question is: “Could we construct a general deterministic rule performing fast colouring of tilings like the Penrose one?”
- The problem is studied on a regular square grid due to its simplicity (rem. mod  $(x+y)$ )
- Could be the final algorithm used for the Penrose tiling?
- The three neighbour case as the way from the regular grid towards the Penrose case

# Rule B1 - vertical

---

- **B1:** If  $time \% 4 = 0$ 
  - (a) and if the colour of  $[-1,-1]$  is white, the colour of  $[0,-1]$  is black, and  $y \% 2 = 0$  then colour of  $[0,0]$  becomes white,
  - (b) or if the colour of  $[-1,-1]$  is black, the colour of  $[0,-1]$  is white, and  $y \% 2 = 0$  then colour of  $[0,0]$  becomes black.

# Rule B2 - vertical

---

- **B2:** If  $time \% 4 = 1$ 
  - (a) and if the colour of  $[-1,-1]$  is white, the colour of  $[0,-1]$  is black, and  $y \% 2 = 1$  then colour of  $[0,0]$  becomes white,
  - (b) or if the colour of  $[-1,-1]$  is black, the colour of  $[0,-1]$  is white, and  $y \% 2 = 1$  then colour of  $[0,0]$  becomes black.

# Rule B3 - horizontal

---

- **B3:** If  $time \% 4 = 2$ 
  - (a) and if the colour of  $[-1,-1]$  is white, the colour of  $[-1,0]$  is black, and  $x \% 2 = 0$  then colour of  $[0,0]$  becomes white,
  - (b) or if the colour of  $[-1,-1]$  is black, the colour of  $[-1,0]$  is white, and  $x \% 2 = 0$  then colour of  $[0,0]$  becomes black.

# Rule B4 - horizontal

---

- **B4:** If  $time \% 4 = 3$ 
  - (a) and if the colour of  $[-1,-1]$  is white, the colour of  $[-1,0]$  is black, and  $x \% 2 = 1$  then colour of  $[0,0]$  becomes white,
  - (b) or if the colour of  $[-1,-1]$  is black, the colour of  $[-1,0]$  is white, and  $x \% 2 = 1$  then colour of  $[0,0]$  becomes black.

**B4**

# Rule L1 – left edge

---

- **L1:** If  $time \% 2 = 0$ 
  - (a) and if the colour of  $[0,-1]$  is black, and  $y \% 2 = 0$  then colour of  $[0,0]$  becomes white,
  - (b) or if the colour of  $[0,-1]$  is white, and  $y \% 2 = 0$  then colour of  $[0,0]$  becomes black.

# Rule L2 – left edge

---

- **L2:** If  $time \% 2 = 1$ 
  - (a) and if the colour of  $[0,-1]$  is black, and  $y \% 2 = 1$  then colour of  $[0,0]$  becomes white,
  - (b) or if the colour of  $[0,-1]$  is white, and  $y \% 2 = 1$  then colour of  $[0,0]$  becomes black.

**B1**

**B3**

**B2**

**B4**

# Rule D1 – bottom edge

---

- **D1:** If  $time \% 2 = 0$ 
  - (a) and if the colour of  $[-1,0]$  is black, and  $x \% 2 = 0$  then colour of  $[0,0]$  becomes white,
  - (b) or if the colour of  $[-1,0]$  is white, and  $x \% 2 = 0$  then colour of  $[0,0]$  becomes black.

# Rule D2 – bottom edge

---

- **D2:** If  $time \% 2 = 1$ 
  - (a) and if the colour of  $[-1,0]$  is black, and  $x \% 2 = 1$  then colour of  $[0,0]$  becomes white,
  - (b) or if the colour of  $[-1,0]$  is white, and  $x \% 2 = 1$  then colour of  $[0,0]$  becomes black.

# An initial configuration

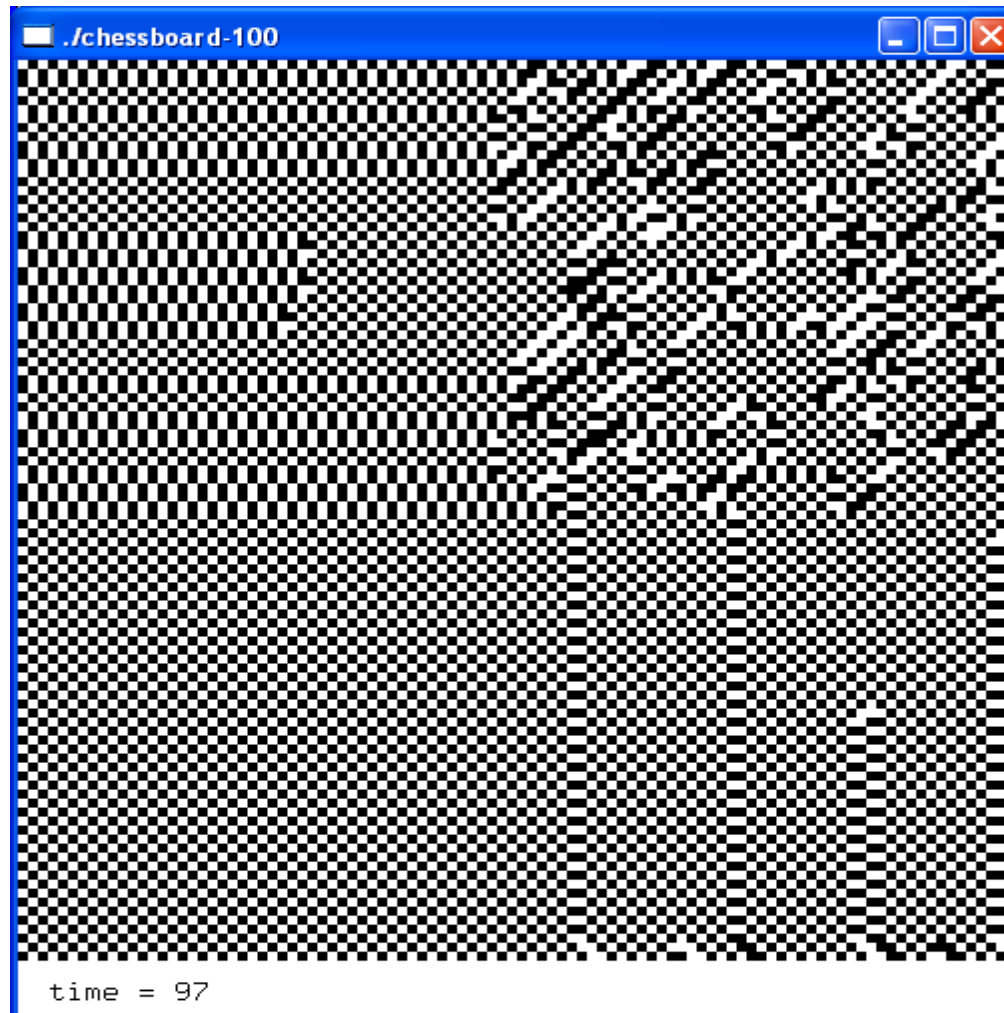

---

An random intial condition of the world having size 20 x 20 cells is provided here as a simple example.

# Evolution sequence - detail

---

# Evolution sequence - random

---

# Antiphase separation border

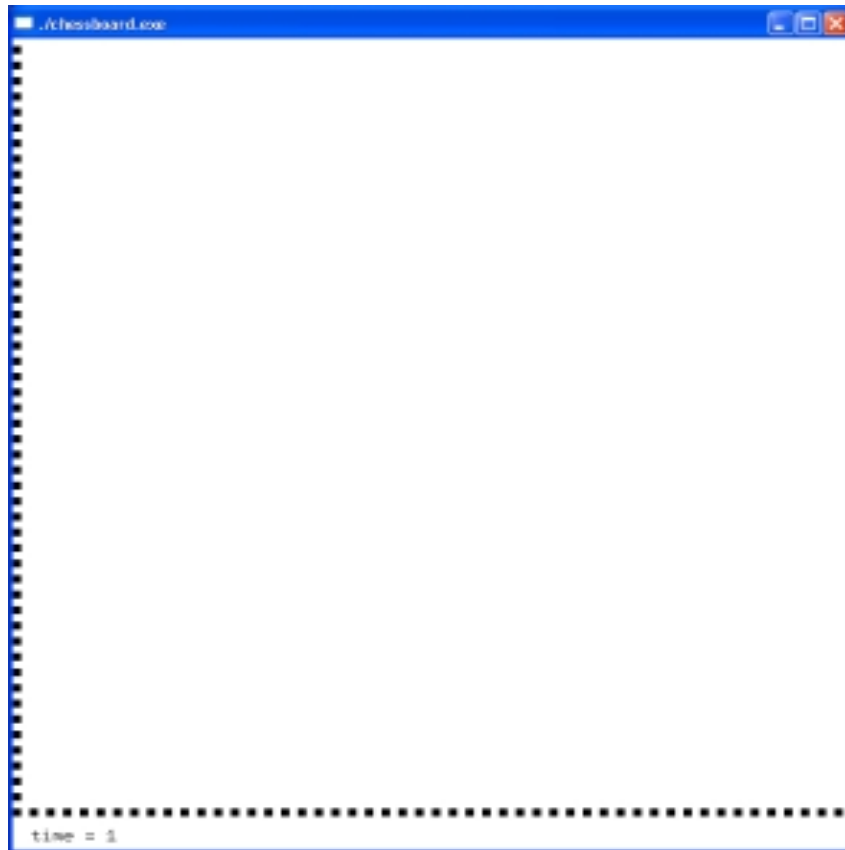

---

The total simulation time is 195 steps in this case!  
A substantial time increase.

# Evolution sequence - seed

---

# Evolution sequence - seed

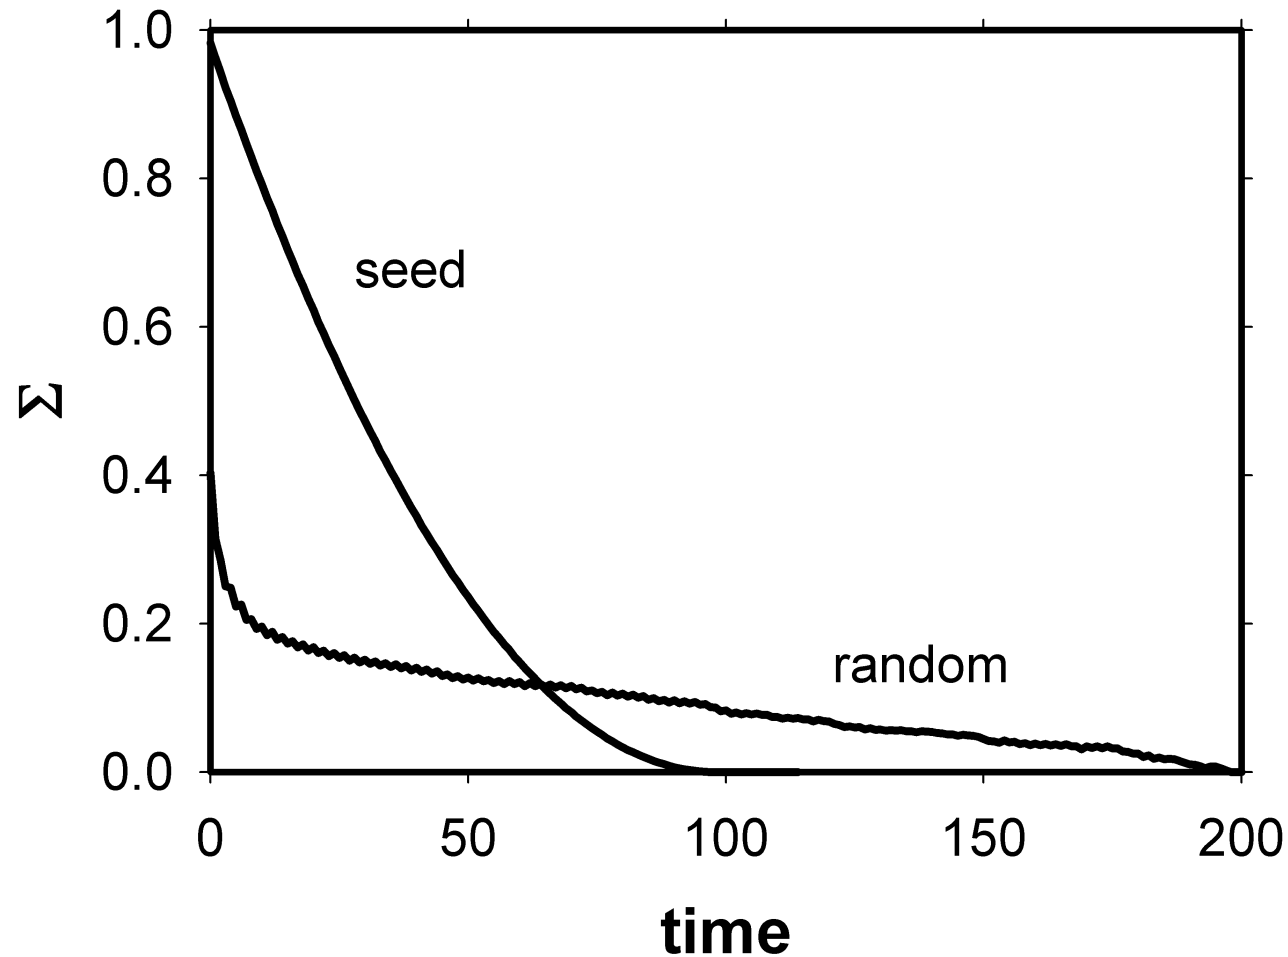

---

# Disorganization vs time

---

Evolution of the disorganization level. The total incompatibility is equal to one.

# Conclusions

---

- Two things are important to fulfill simultaneously:
  - Find an effective rule
  - The initial conditions of the simulation
- It is not enough to find just an effective rule!
- It could lead to a tremendous computational load in more complicated cases than this simple one presented here!

# Conclusions - continues

---

- It obvious from this that although there is a solution of the problem the enormous number of attempts is necessary to start the correct process
- Hence, the work from looking for a rule is shifted towards the problem with 'waiting time' for having good luck with correct initial conditions
- Exactly as **THE NATURE** does!
